

ABSTRACT

A unitary multi-purpose elongated strap has at one end a pair of loops adapted for securement to a human body or inanimate object, and at the other end has at least one, and preferably two, loops for enabling control of the person or thing secured by the pair of loops. The strap has a large variety of uses, such as in the fields of rescue, personal rehabilitation, training, anchoring, towing, lifting and other uses as yet undiscovered. The design can be identical for all uses, although the strap lengths and proportions may vary for different uses.
